Energy security of Poland

This paper describes the state of energy security of Visegrad countries in the aspect of natural gas. The dependence of all countries on supplies from the Russian Federation is a serious threat to their security. Monopolization of the market forces the search for alternatives in the form of development of LNG gas terminals, interconnections and the construction of internal markets. Implementation of EU energy law is a very good direction to diversify gas supplies for these countries.

Key words: **energy security, natural gas, Visegrad Group, Russian Federation, diversification**
